DataVIEW

Managing technology complexity

With data storage rates growing at 50-60% per year, now more than ever it pays to know how those resources are provisioned.

DataVIEW Storage Assessment uses a unique set of tools to examine the way you use your storage resources. Through this process, the storage environment is exposed - divulging critical information about what types of data are using the storage resources and what are their relevant ages.

Storage Facts:

- Traditional storage management tools are complex
- Data Growth rates are +/- 60% while performance increases at 10% per year
- Much of the data is aging or obsolete
- Compliance and regulations force more data to be held for longer periods
- IT staffs are decreasing, budgets are flat, leaving resource management behind
- Aging data decreases in value, but the costs to store and protect it increases
- Studies suggest that 97% more data storage can be managed when pooled storage or management tools are in place
- Backup windows can be reduced up to 70% by offloading reference materials from the primary storage (archiving).
